**Subject:** Re: [ScanNet] Requesting for Scannet dataset

Thank you for your interest in ScanNet. Please use the following script to download the ScanNet data: <http://kaldir.vc.in.tum.de/scannet/download-scannet.py>.

Note that by default this script will download the newest (v2) release of the ScanNet data (see the [changelog](#)); older versions can still be downloaded by specifying the version (e.g., --v1).

Some useful info:

Scan data is named by scene[spaceid]\_[scanid], or scene%04d\_%02d, where each space corresponds to a unique location (0-indexed).

Script usage:

- To download the entire ScanNet release (1.3TB): download-scannet.py -o [directory in which to download]
- To download a specific scan (e.g., scene0000\_00): download-scannet.py -o [directory in which to download] --id scene0000\_00
- To download a specific file type (e.g., \*.sens, valid file suffixes listed [here](#)): download-scannet.py -o [directory in which to download] --type .sens
- To download the ScanNet v1 task data (inc. trained models): download-scannet.py -o [directory in which to download] --task\_data
- Train/test splits are given in the main ScanNet project repository: <https://github.com/ScanNet/ScanNet/tree/master/Tasks/Benchmark>

License: ScanNet data is released under the [Terms of Use](#); code is released under the MIT license.
